Mobile Retrospective Encoder

The FE Technologies Mobile Retrospective Encoder is a completely mobile and very effective stock-take tool. The unit is powered by a cable-less 12 hours battery pack. The trolley features a touch screen interface, barcode scanner and encoder.

The battery charge indicator light:

1. Green: battery fully charged (voltage >12.5)
2. Yellow: battery semi-charged (voltage = 11 to 12.5)
3. Red: battery low (voltage <11)

The battery should be charged and discharged properly to obtain optimum performance and extend the life of the system.

An item file is uploaded to the unit prior to the commencement of conversion (no connection to the LMS is required). The fields to be encoded (the tag data layout, default source of encoded data, etc.) are configured from the Management Console. As each item's barcode is scanned, the item is recorded. An encoded tag is issued immediately and ready to apply. Furthermore, the Mobile Retrospective Encoder has an RFID pad that checks if an item doesn't already have an RFID tag – which avoids wasting RFID tags and operator time. Once a library has been retrospectively tagged, the library is immediately secure. All tags are set to security status "on" and any items removed from the library without being checked-out will alarm the gates.

The Management Console will be setup on the system by FE Technologies support person to suit your library's needs before you start the encoding process. The settings options available to you from the "settings" button will depend on the initial setup and should not be changed without consultation with FE Technologies.

The cabinet contains high voltage electronic equipment and is locked prior to delivery. Under no circumstances is any part of the hardware to be opened or tampered with in any way unless specifically instructed by an FE Technologies technician.
